# PURSUE data at a glance

- Roughly 300 participants across three institutions (U of Richmond, Claremont McKenna, Hampshire College)
- 6 Event Related Potential Tasks (ERP CORE)
  - N170 (Face Perception Paradigm)
  - MMN (Passive Auditory Oddball Paradigm)
  - N2pc (Simple Visual Search Paradigm)
  - N400 (Word Pair Judgement Paradigm)
  - P3b (Active Visual Oddball Paradigm)
  - LRP and ERN (Flankers Paradigm)
- 15+ Individual/Group Differences Measures
  - Demographics (e.g. gender, SES)
  - Clinical Inventories (e.g. Beck Depression/Anxiety inventories)
  - Cognitive Tasks (e.g. working memory, executive function)

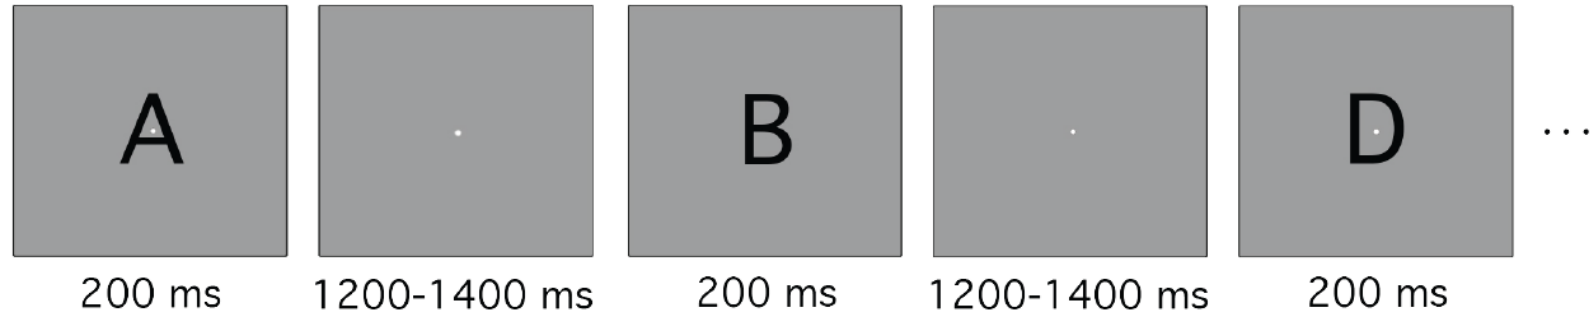

# Sample ERP Data Sets

- 20 participants for each of three components
  - P300/P3b
  - N400
  - N2pc
- 5 Individual/Group Differences Measures for each component

# ERP Tasks

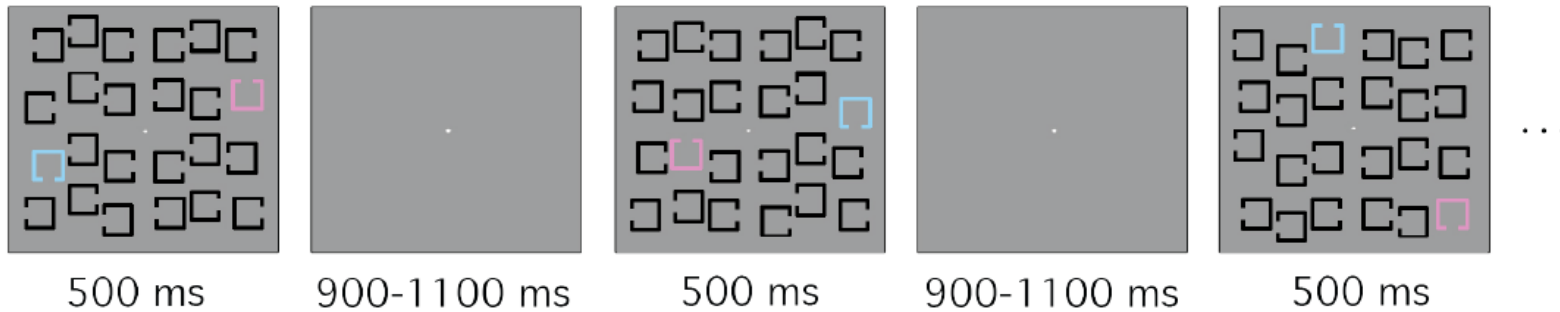

E. Active Visual Oddball P3

D. Word Pair Judgement N400

C. Simple Visual Search N2pc

Kappenman et al., 2020

# Available Individual/Group Differences

- P300

- Hours of Sleep
- Perceived Stress
- Beck Depression Inventory
- Beck Anxiety Inventory
- Autism Quotient Scale

- N400

- Number of Languages Spoken
- Visual Working Memory Accuracy
- Spatial Working Memory Accuracy
- Beck Depression Inventory
- Beck Anxiety Inventory

- N2pc

- Visual Search Task Accuracy
- Visual Search Task Reaction Time
- Visual Working Memory Accuracy
- Spatial Working Memory Accuracy
- Autism Quotient Scale

- Gender and Age are provided in all datasets

# What Files Are Provided?

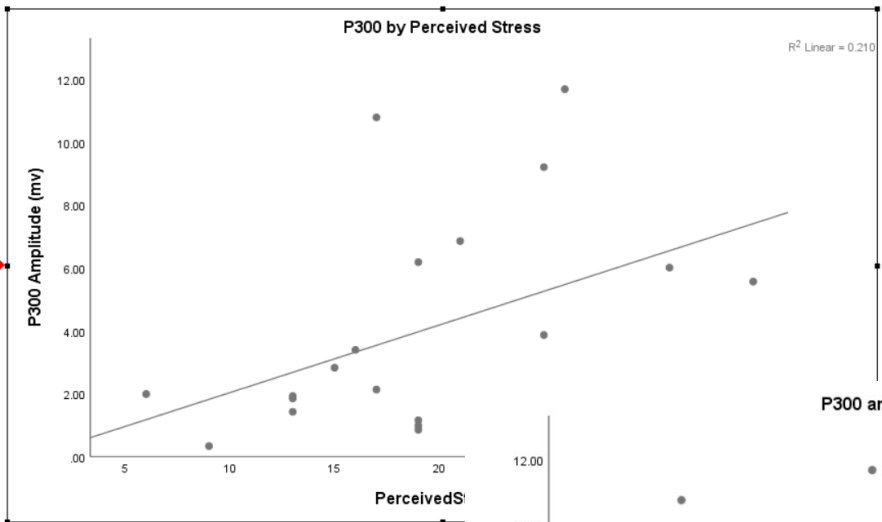

- Raw Data Files for Each Participant (BrainVision)
- Average File for Each Participant (ERPlab)
- BDF Files, Re-referencing File
  - Excel Sheet that provides a legend of bins in BDF files
- Excel Sheet with Individual Differences and Amplitude Data for Electrodes of Interest (latency in some cases)
- Overview of the methods for ERPs and Behavioral Tasks/Surveys
- Overview of how the data is coded in the Excel Sheet along with what students might find in the data

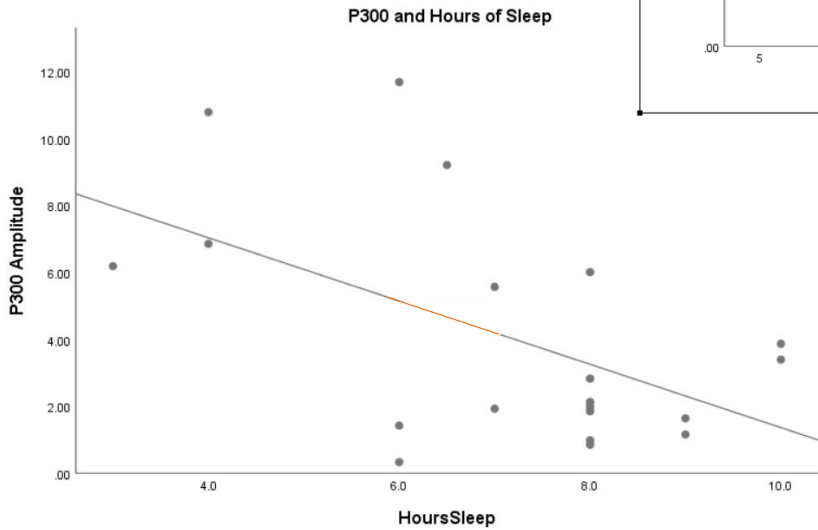

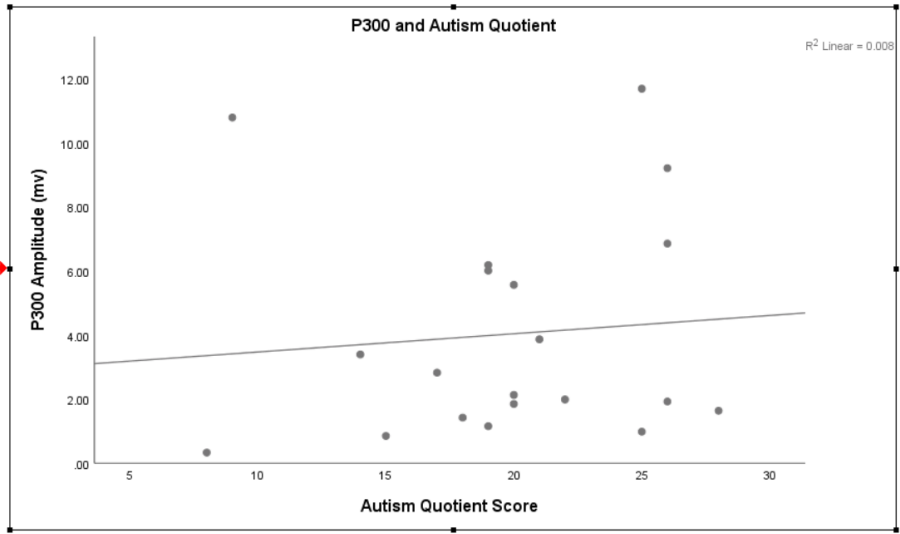

# What is in the data???

None

Positive

Negative

- Tutorial Videos

For this lab please follow along and answer for yourself all the questions to #9 and #10 please answer them on this document.

## Filtering

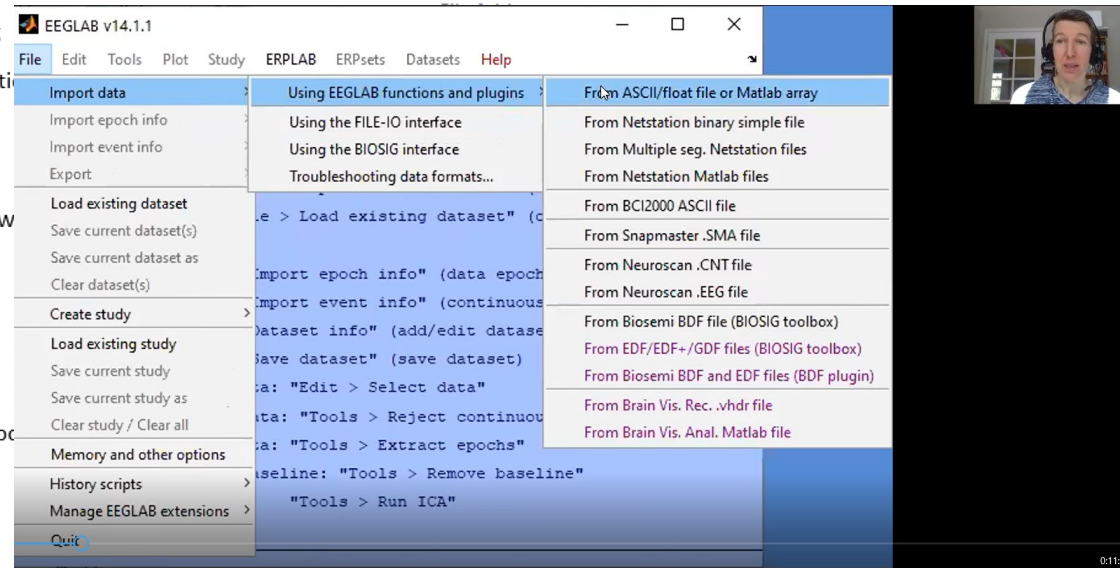

In this lab you will learn to open a file and filter the data. You will

WordPr (N400) 1070 and 1096

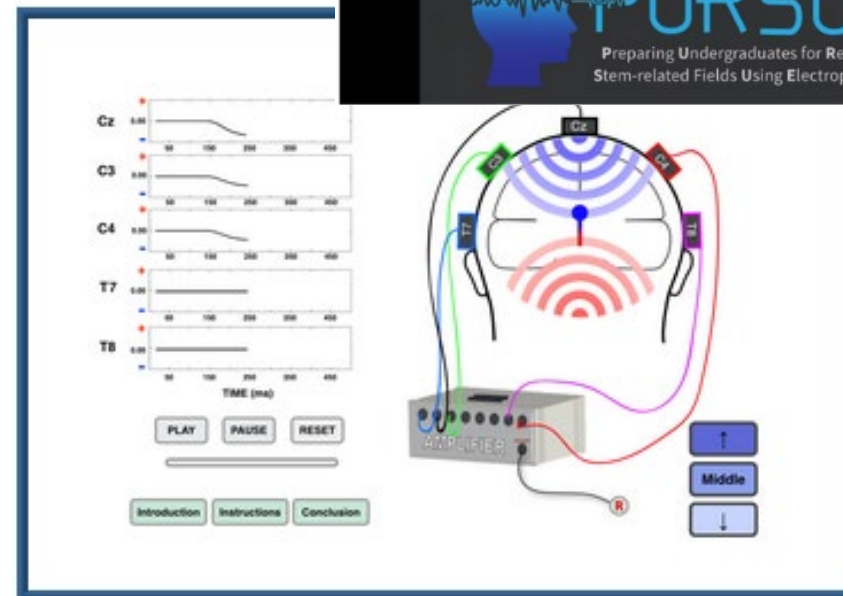

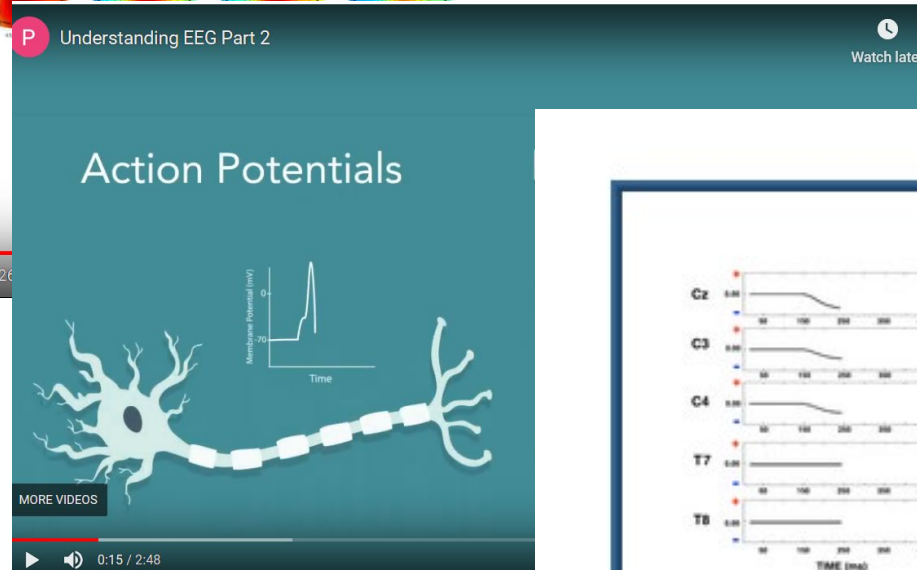

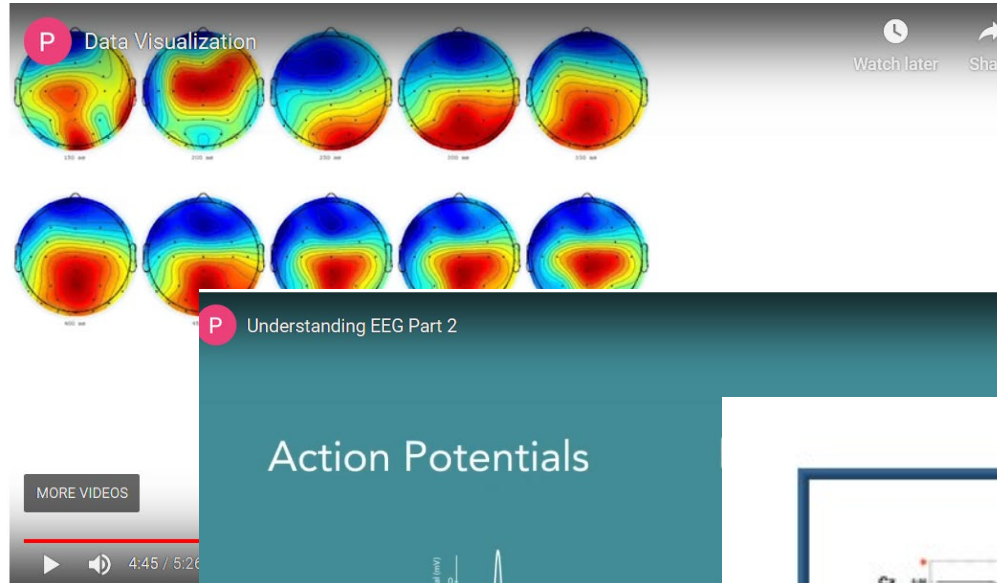

Setting up the files:

1. Open Matlab & EEGLab & ERPLab
  - a. You will work between EEGLab and ERPLab to preprocess
  - b. Click on Matlab icon
  - c. In main window type "eeglab" to start EEGLAB
    - i. `>> eeglab`
    - ii. GUI comes up in small blue box
  - d. ERPLab should be a pull down menu at the top of the EEGLAB GUI

## Lab Activity Module 7 Filtering

# Animations, Interactive Simulations and Videos

# Introduction to EEG/ERP

## Event-related Potentials (ERPs)

- ERPs are averaged over trials of the same condition to reduce noise and reveal the underlying pattern associated with the event

CC 4.0 by Emilia Hagen 2016

Raw EEG

Dichter & Kieffaber (2013). EEG M...  
for the Psychological Sciences. NY:

## Where does the EEG Signal Come From?

### Postsynaptic Potentials

- Affect local ion concentrations surrounding the cell

### Dipoles

- A difference of charge between two parts of the neuron

### Summation

- Synchronous dipoles from aligned neurons summate

### Scalp Distribution

- Dipole potentials spread to scalp

### EEG Waveforms

- Electrodes measure changes in scalp voltage over time

- Short Introductory Slides
  - Can use part or whole as an insert in a class
- Introduction to ERPs (2 Day Class Series)

Weekly Class Schedule

### Course Description

The primary goals of this course are to learn about methodology, and to conduct a study from develop analysis on the topic chosen by the class – we will area groups early in the semester. The course will theory behind event related potentials as well as of research methodologies and ERP techniques as y develop and implement an ERP study.

### Instructor:

Dr. Jane W. Couperus

### Student Check-In Hc

9:00-10:00AM EST Mon, Wed.  
12:45-1:45PM EST Thurs. or by a  
Please feel free to email me to set  
appointment at anytime.

### Course Learning Goals

- Develop an understanding the neurological underpinnings of Event Related Pot Research and common ERP components.
- Develop the ability to design and program a research study
- Develop the ability to processes ERP data for statistical analysis

Event-related potentials (ERPs) are electrical *potentials* generated by the brain that are *related* to specific internal or external *events* (e.g., stimuli, responses, decisions). They can be recorded noninvasively from almost any group of research participants, and they can provide information about a broad range of cognitive and affective processes. Consequently, the ERP technique has become a common tool in almost all areas of psychological research, and students and researchers must be able to understand and evaluate ERP studies in the literature. These studies often involve a set of terms and concepts that are unfamiliar to many psychologists, however; several technical issues must be understood before a student or researcher can read and evaluate ERP studies. This chapter provides students and researchers with this background information so that they can be informed consumers of ERP studies in their area of interest. More detailed works are available for those who would like to learn more or who would like to conduct their own ERP experiments (Handy, 2005; Luck, 2005).

This chapter begins with an example of a particu-

### CHAPTER 27

## EVENT-RELATED POTENTIALS

Steven J. Luck

ERPs. The next sections describe how ERP erated in the brain and how the neural gen of a given ERP can be localized. This infor followed by a discussion of the basic techni involved in recording and analyzing ERPs, study of impaired cognition in schizophre patients as a concrete example. The chapte with a set of questions that should be aske reading and evaluating an ERP study.

### EXAMPLE 1: THE N170 COMPONENT AND FACE PROCESSING

Figure 27.1 shows the results of an experim ing on the N170 component, a negative-goi over visual cortex that typically peaks aroun after stimulus onset. In a typical N170 para tographs of faces and various types of nonfa are briefly flashed on a computer monitor and the participants passively view the stimuli. In the ERP waveforms shown in Figure 27.1a, the x-axis represents time relative to stimulus onset (measured in milliseconds) and the y-axis represents the magnitude

### Luck: Chapter 27 – Event-Related Potentials (2012)

Luck, S. J. (2012). *Event-related potentials*. In H. Cooper, P. M. Camic, D. L. Long, A. T. Panter, D. Rindskopf, & K. J. Sher (Eds.), *APA handbooks in psychology®. APA handbook of research methods in psychology, Vol. 1. Foundations, planning, measures, and psychometrics* (p. 523–546). American Psychological Association. <https://doi.org/10.1037/13619-028>

This chapter introduces common ERP components as well as specific examples of components encountered in various ERP experiments. The example of a study on the N170 component shows how ERPs are beneficial in cognitive neuroscience research. The discussion of the particular benefits of analyzing ERPs over other methods is informative. ERP components are defined and explained in-depth (e.g., how it relates to cognitive function, the origin of its name, its general range or latency, and other common characteristics). Luck uses an example experiment about impaired cognition in schizophrenia to demonstrate various facets of analyzing ERPs (e.g., difference waves, artifact correction, extracting averaged ERPs, and quantifying latency and amplitude). Luck then examines the electrical activity of postsynaptic potentials, several limitations of ERPs (including difficulties with localization), and statistical analyses in ERP analyses. He concludes by providing a list of twelve questions to consider when evaluating ERP studies.

### Ratings:

|                                 |     |   |
|---------------------------------|-----|---|
| Content Rating                  | 2.3 | <ul style="list-style-type: none"><li>• Very relevant to an introductory course, but some specific information about common ERP components may be too detailed for a general methods course</li><li>• More relevant for a module or later in a ERP course</li><li>• Useful resource to come back to when analyzing ERP waveforms.</li></ul> |
| Content Complexity Level Rating | 2.0 | <ul style="list-style-type: none"><li>• Several terms and concepts were unclear to the novice reader</li><li>• Information about specific components would be easier to understand with previous exposure</li><li>• Overall, it was easy to follow with helpful examples</li></ul>  |
| Interest Level Rating           | 1.9 | <ul style="list-style-type: none"><li>• Very engaging because the specific examples made the material more approachable and interesting</li><li>• Consider only including the examples and pairing with Luck 2014 (above)</li></ul>   |
| Length Rating                   | 3.1 | <ul style="list-style-type: none"><li>• 24 pages -- took a while to finish, but it was engaging</li></ul>   |
| Overall Combination Rating      | 2.1 | <ul style="list-style-type: none"><li>• This reading would be helpful to read before a lecture and can be read independently</li><li>• Concepts are relevant and do not feel overwhelming</li></ul>   |

# Future Materials, Trainings and Workshops

- **Modular Full Semester Course**

## **Module 1: Introduction**

1. Conceptual Overview

## **Module 2: From Neuron to Waveform**

1. Physiology
2. Measurement

## **Module 3: ERP Components**

1. ERP Components and Neural Sources
2. ERP Components and Associations with Cognitive Processes
3. Reading ERP Papers: Research Question and Hypothesis

## **Module 4: Basics of Research Design**

1. Introduction to Research Design
2. Design Details
3. Reading ERP Papers: Research Design Elements

## **Module 5: Programming the Experiment**

1. Parameters of the Experimental Design
2. Programming the Study
3. Ethical Considerations

## **Module 6 Data Collection**

1. ERP Recording
2. Capping

## **Module 7 Data Preprocessing**

1. Early Preprocessing Steps
2. Artifact Rejection and Correction

## **Module 8 Averaging**

1. Averaging Subject Data
2. Creating an ERP waveform
3. Grand Averages
4. Plotting and Interpreting ERP Components

## **Module 9 Waveform Quantification and Statistics**

1. Quantifying Waveforms
2. Extracting Measurements in ERPLab
3. Statistical Analysis

## **Module 10 Data Visualization and Interpretation**

1. Evaluating and Creating Waveforms
2. Reading ERP Papers: Interpreting Results
3. Writing an ERP Paper
